Task 1: Guided Activity, Student profile card

```
import Foundation
let studentName = "Nalayini P"
let rollNumber: Int = 330
var semester: Int = 6
var cgpa: Double = 8.07
let isHosteller: Bool = true
print("Name: \(studentName), Roll: \(rollNumber), Semester: \(semester)")
semester += 1
cgpa = 8.70
print("Name: \(studentName), Roll: \(rollNumber), Semester: \(semester), CGPA: \(cgpa)")
//studentName = "Nalayini"
print(type(of: studentName))
print(type(of: rollNumber))
print(type(of: semester))
print(type(of: cgpa))
print(type(of: isHosteller))
```

OUTPUT:

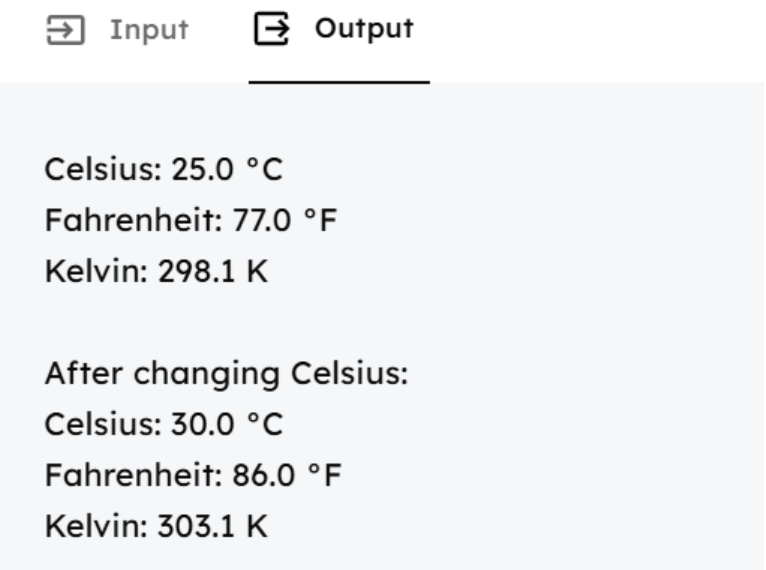

Task 2: Practice Task, Temperature converter

```
import Foundation
var celsius: Double = 25.0
var fahrenheit = celsius * (9.0/5.0)+32.0
var kelvin = celsius + 273.15print("Celsius: \(String(format: "%.1f", celsius)) °C")
print("Fahrenheit: \(String(format: "%.1f", fahrenheit)) °F")
```

```
print("Kelvin: \(String(format: "%.1f", kelvin)) K")
celsius = 30.0
fahrenheit = celsius * (9.0/5.0)+32.0
kelvin = celsius + 273.15
print("\nAfter changing Celsius:")
print("Celsius: \(String(format: "%.1f", celsius)) °C")
print("Fahrenheit: \(String(format: "%.1f", fahrenheit)) °F")
print("Kelvin: \(String(format: "%.1f", kelvin)) K")
```

OUTPUT:

Task 3: Debug Task, Fix the compile errors

```
let price = 250
var quantity: Int = 3
let taxRate = 0.18
price = 300
let total = price * quantity * taxRate
var title = "Order"
title = 42
print(total)
```

Error:

price = 300 -> price was declared using let, so its value cannot be changed. Use var if it must change.

price * quantity * taxRate -> Cannot convert value of type Double to expected argument type Int price and
quantity are integers, but taxRate is a Double. Convert the price to Double before multiplying.
title = 42 -> Cannot assign value of type Int to type String title was initialized with "Order", so Swift inferred its
type as String. Assign text instead.

Corrected Code:

```
import Foundation
var price: Double = 250.0
var quantity: Int = 3
let taxRate: Double = 0.18
price=300.0
let subtotal=price*Double(quantity)
let tax=subtotal*taxRate
let total = subtotal+tax
var title = "Order"
print("Title:\(title)")
print("subtotal:\(subtotal)")
print("Tax:\(tax)")
print("total:\(total)")
```

OUTPUT:
